

Enter the following data here at **the end** of the child's therapy (**i.e., discharge**):

		Response
A	On average, how many targets were elicited per session?	
B	On average, how often were sessions provided in a week?	
C	How many sessions in total were provided?	
To find the total amount of intervention provided: Multiply $A \times B \times C =$		

Dose Rate:

		Response
A	On average, how many targets were elicited per session?	
B	On average, how long were sessions?	
To find the total amount of intervention provided: Divide $A \div B =$
